

24th November 2017

Press Release

Today, SandenVendo revealed its new ECO concept at EVEX Rome 2017.

SandenVendo, recognized for its long history, heritage and reliability in manufacturing Vending Machines has presented its first machine using hydrocarbon R290 as refrigerant : the **G-Drink HC**. The machine has just presented at EVEX Rome, organized by European Vending Association.

R290 (Hydro Carbon) is a natural commercially available refrigerant.

The non-toxic hydrocarbons are an eco-friendly alternative to the CFC/HCFC/HFC fluorocarbons related to ozone damage. SandenVendo has met this challenge by pioneering an innovative patent pending process where R290 is safely applied for the current range of refrigerated vending machines.

The cooling unit of SandenVendo has proven to be one of the best on the market backed by its long history of expertise in thermo-dynamics and cooling technologies.

SandenVendo proudly present a new, Eco-Friendly version of G-Drink HC along with the CO₂ cooling unit. SandenVendo is a producer of Vending machine with CO₂ cooling unit since 2004.

Sanden group strives to create ECO-friendly solutions by applying **Natural Refrigerants**, in order to reduce the direct and indirect emission of greenhouse gases and less impact on GWP. Both **CO₂** (R744) and **HC** (R290) refrigerants has minimal GWP and Zero ODP.

G-Drink is by far the best selling model of SandenVendo. The products are handled by robotic catcher and swiftly delivered at a ergonomic height delivery area, so that customers do not need to bend down to collect the products they have bought. The delivery area is designed at an optimal comfort zone according to ergonomic principals where a neutral posture is maintained while collecting the products, ensuring minimum stress to the body with a simple single-handed operation. It is fitted with a safety sensor; the front flap will remain open when it detects obstacles.
